

Question 2 Page 1 of 9

Solution: 2. Mechanical Blackbox: a cylinder with a ball inside

In order to be able to calculate the required values in i, ii, iii, we need to know:

- a. the position of the centre of mass of the tubing plus particle (object) which depends on z, m, M
- b. the moment of inertia of the above.

The position of the CM may be found by balancing. The I_{CM} can be calculated from the period of oscillation of the tubing plus object.

Analytical steps to select parameters for plotting

I.
$$x_{CM} = \frac{mz + M(L/2)}{m + M}$$
 (1)

L is readily obtainable with a ruler.

 $x_{\rm CM}$ is determined by balancing the tubing and object.

Q2_EXPERIMENT_SOLUTION_FINAL.DOCX Experimental Competition: 14 July 2011

Question 2

Page 2 of 9

II. For small-amplitude oscillation about any point O the period *T* is given by considering the equation:

$$T = 2\pi \sqrt{\frac{I_{CM} + (M+m)R^{2}}{g(M+m)R}}$$
 (3)

where

$$I_{CM} = \frac{1}{3}M\left(\frac{L}{2}\right)^2 + M\left(x_{CM} - \frac{L}{2}\right)^2 + m(z - x_{CM})^2$$

$$= \frac{1}{3}ML^2 + Mx_{CM}^2 - MLx_{CM} + m(z - x_{CM})^2 \qquad (4)$$

Note that

$$T^{2} \frac{g(M+m)}{4\pi^{2}} = \frac{I_{CM}}{R} + (M+m)R \qquad (5)$$

Method (a): (linear graph method)

The equation (5) may be put in the form:

$$T^{2}R = \left(\frac{4\pi^{2}}{g}\right)R^{2} + \frac{4\pi^{2}I_{CM}}{(M+m)g}$$
 (6)

Hence the plot of T^2R v.s. R^2 will yield the straight line whose

Slope
$$\alpha = \frac{4\pi^2}{g}$$
 (7)

and y-intercept
$$\beta = \frac{4\pi^2 I_{CM}}{(M+m)g}$$
 (8)

Hence,
$$I_{CM} = (M+m)\frac{\beta}{\alpha}$$
 (9)

The value of g is from equation (7): $g = \frac{4\pi^2}{\alpha}$ (10)

Q2_EXPERIMENT_SOLUTION_FINAL.DOCX Experimental Competition: 14 July 2011

Question 2

Page 3 of 9

Method (b): minimum point curve method

The equation (5) implies that T has a minimum value at

$$R = R_{\min} \equiv \sqrt{\frac{I_{CM}}{M+m}} \tag{11}$$

Hence R_{\min} can be obtained from the graph T v.s. R.

And therefore
$$I_{CM} = (M+m)R_{\min}^2$$
 (12)

This equation (12) together with equation (1) will allow us to calculate the required values z and M/m.

At the value
$$R = R_{\min}$$
 equation (5) becomes $T_{\min}^2 \frac{g(M+m)}{4\pi^2} = (M+m)R_{\min} + (M+m)R_{\min}$

$$g = \frac{2R_{\min}}{T_{\min}^2} \times 4\pi^2 = \frac{8\pi^2 R_{\min}}{T_{\min}^2}$$
 (13)

from which g can be calculated.

Notes: at $x_{CM} - R = 15.1$, 16.1cm, times for 10 cycles.

Q2 EXPERIMENT SOLUTION FINAL.DOCX

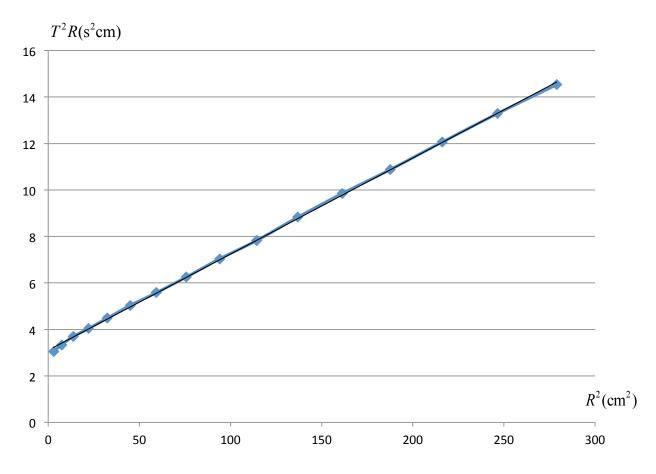

Experimental Competition:

14 July 2011

Question 2

Page 5 of 9

Method (a)

Calculation from straight line graph: slope $\alpha = 0.04108 \pm 0.0007 \,\mathrm{s}^2/\mathrm{cm}$, y-intercept $\beta = 3.10 \pm 0.05 \,\mathrm{s}^2 \mathrm{cm}$

$$g = \frac{4\pi^2}{\alpha} \text{ giving } g = (961 \pm 20) \text{ cm/s}^2$$

$$\frac{\beta}{\alpha} = \frac{3.10}{0.04108} = 75.46 \text{ cm}^2 (\pm 2.5 \text{ cm}^2)$$

$$I_{CM} = (M+m)\frac{\beta}{\alpha} = (75.46)(M+m)$$

From equation (4):
$$I_{CM} = \frac{1}{3}M\left(\frac{L}{2}\right)^2 + M\left(x_{CM} - \frac{L}{2}\right)^2 + m(z - x_{CM})^2$$

Q2_EXPERIMENT_SOLUTION_FINAL.DOCX Experimental Competition: 14 July 2011

Question 2

Page 6 of 9

Then

$$(75.46)(M+m) = 75.0M + 7.84M + m(z-17.8)^{2}$$

$$-7.38\frac{M}{m} + 75.46 = (z - 17.8)^2 \tag{14}$$

The centre of mass position gives:

$$17.8(M+m) = 15.0M + mz$$

$$\frac{M}{m} = \frac{z - 17.8}{2.8}$$
(15)

From equations (14) and (15):

$$-\frac{7.38}{2.8}(z-17.8)+75.46 = (z-17.8)^2$$

$$(z-17.8) = 7.47$$

And

$$z = 25.27 = 25.3 \pm 0.1$$
 cm

$$\frac{M}{m} = 2.68 = 2.7$$

Error Estimation

Find error for g:

From (10),
$$g = \frac{4\pi^2}{\alpha}$$
$$\Delta g = \frac{\Delta \alpha}{\alpha} g = 16.3 \text{ cm/s}^2 \approx 20 \text{ cm/s}^2$$

i) Find error for z:

First, find error for
$$r = \frac{\beta}{\alpha} = \frac{3.10}{0.04108} = 75.46 \text{ cm}^2$$
.

$$\Delta r = (\frac{\Delta \alpha}{\alpha} + \frac{\Delta \beta}{\beta})r = 2.5 \text{ cm}^2$$

Since error from r contributes most $\left(\frac{\Delta r}{r} \sim 0.03 \text{ while } \frac{\Delta L}{L}, \frac{\Delta x_{cm}}{x_{cm}} \sim 0.005\right)$, we estimate error propagation from r only to simplify the analysis by substituting the min and max values into equation (4).

Now, we use $r_{\text{max}} = r + \Delta r = 75.46 + 2.5 = 77.96$. The corresponding quadratic equation is

Q2_EXPERIMENT_SOLUTION_FINAL.DOCX

Experimental Competition: 14 July 2011

Question 2 Page 7 of 9

$$(z-17.8)^2 + 1.743(z-17.8) - 77.96 = 0$$
 The corresponding solution is $(z-17.8)_{\text{max}} = 7.55$ cm
If we use $r_{\text{min}} = r - \Delta r = 75.46 - 2.5 = 72.96$, the corresponding quadratic equation is $(z-17.8)^2 + 3.529(z-17.8) - 72.96 = 0$

The corresponding solution is $(z-17.8)_{min} = 6.96$ cm

So
$$\Delta(z-17.8) = \frac{7.55-6.96}{2} = 0.3 \text{ cm}$$

Note that $\frac{\Delta(z-17.8)}{z-17.8} \sim 0.04$. So, we still ignore the error propagation due to ΔL , Δx_{cm}

The error Δz can be estimated from $\Delta z \approx \Delta(z-17.8) = 0.3$ cm

ii) Find error for $\frac{M}{m}$:

We know that
$$\frac{M}{m} = \frac{z - 17.8}{2.8}$$

$$\Delta \left(\frac{M}{m}\right) = \frac{\Delta(z - 17.8)}{2.8} = 0.11$$

Q2_EXPERIMENT_SOLUTION_FINAL.DOCX

Experimental Competition:

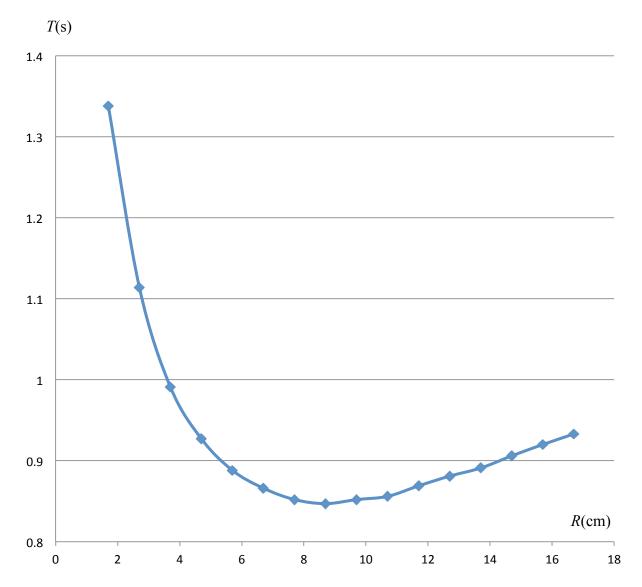

14 July 2011

Question 2

Page 8 of 9

Method (b)

Calculation from *T-R* plot:

Using the minimum position: $T = T_{\min}$ at $I_{CM} = (M+m)R_{\min}^2$ and $g = \frac{8\pi^2 R_{\min}}{T_{\min}^2}$

From graph: $R_{\rm min} = 8.9 \pm 0.2$ cm and $T_{\rm min} = 0.846 \pm 0.005$ s

$$g = 982 \pm 40 \text{ cm/s}^2$$

$$I_{CM} = (M+m)(8.9)^2 = (79.21)(M+m)$$
(16)

Q2 EXPERIMENT SOLUTION FINAL.DOCX 14 July 2011

Experimental Competition:

Question 2 Page 9 of 9

From equations (14), (15), (16):

$$(79.21)(M+m) = 75.0M + 7.84M + m(z-17.8)^{2}$$

$$-3.63M + 79.21m = m(z-17.8)^{2}$$

$$(x-17.8)^{2} + \frac{3.63}{2.8}(x-17.8) - 79.21 = 0$$

$$(z-17.8) = 8.28$$

$$z = 26.08 = 26.1 \pm 0.7 \text{ cm}$$

$$\frac{M}{m} = 2.95 = 3.0 \pm 0.3$$

Error estimation

And

Find error for g: i)

Using the minimum position: $g = \frac{8\pi^2 R_{\min}}{T_{\min}^2}$, we have

$$\Delta g = \left(\frac{\Delta R_{\min}}{R_{\min}} + 2\frac{\Delta T_{\min}}{T_{\min}}\right)g = 34 \approx 30 \text{ cm/s}^2$$

ii) Find error for z:

First, find error for $r = R_{\min}^2 = 79.21 \text{ cm}^2$.

$$\Delta r = 2R_{\min} \Delta R_{\min} = 3.56 \text{ cm}^2$$

This r is equivalent to r in part 1. So, one can follow the same error analysis.

As a result, we have

$$z = 26.08 \approx 26.1 \text{ cm}$$

 $\Delta z = 0.8 \text{ cm}$

i) Find error for M/m:

Following the same analysis as in part I, we found that

$$M/m = 2.96$$
; $\Delta(M/m) = 0.15$

NOTE: This minimum curve method is not as accurate as the usual straight line graph.
